IETF

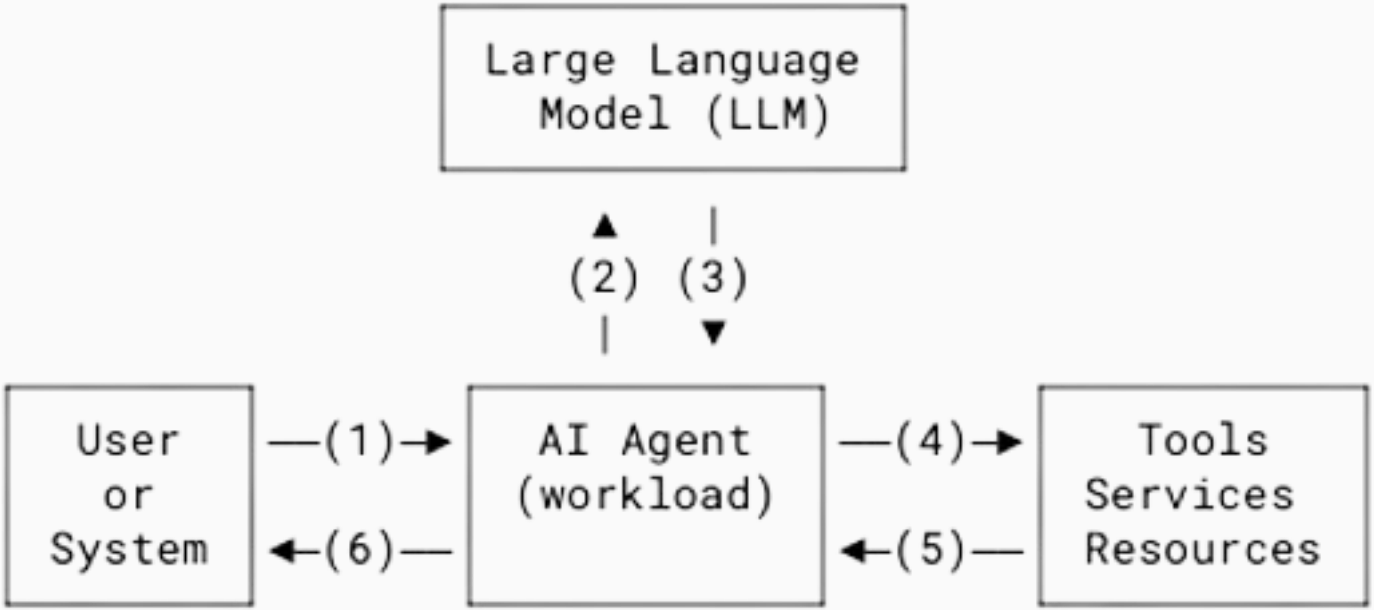
AI agents

IETF

AI agents require identity

IETF

Background: Agents are workloads



Motivation

AI is exploding. We need guardrails as soon as possible!

- There is a tendency to invent new “AI” protocols
- We MUST leverage the learnings and exiting standards of several decades of identity, authentication, and authorization
- There is a wide spectrum of standards involved, but there is no single framework guiding implementers to the right places

- We MAY locate missing pieces in existing standards to surgically address them

IETF

Background: What is this draft?

Informational draft to map existing (mainly IETF) technologies to Agentic communications auth

<table>
<tr><td rowspan="7">Policy</td><td>Monitoring, Observability & Remediation</td><td rowspan="7">Compliance</td></tr>
<tr><td>Authorization</td></tr>
<tr><td>Authentication</td></tr>
<tr><td>Provisioning</td></tr>
<tr><td>Attestation</td></tr>
<tr><td>Credentials</td></tr>
<tr><td>Identifier</td></tr>
</table>

- Identifiers
- Credential Format
- Attestation
- Provisioning
- Authentication
- Authorization
- Monitoring and Observability

Background: Key building blocks

- WIMSE identifier for agentic AI identity
- WIMSE credentials and authentication for AI authentication
- OAuth 2.0 for authorization and delegation
- SSF/CAEP for monitoring and observability

Q&A
